# Solving the guiding center model using the Semi-Lagrangian scheme on a 2D hexagonal mesh (SelHex)

Michel Mehrenberger, Laura Mendoza, Charles Prouveur, Eric Sonnendrücker

October 22, 2014

## Table of contents

## Motivation

Current representation of the poloidal plane :

- Annular geometry
- Polar mesh  $(r, \theta)$

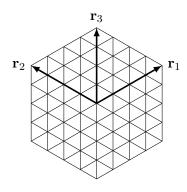

Some limitations of this choice:

- Geometric (and numeric)
  singular point at origin of mesh
- Unrepresented area and very costly to minimize that area
- Impossible to represent complex geometries

# The hexagonal mesh

**Idea:** Use a new mapping: hexagon  $\longrightarrow$  circle.

We define a tiling of triangles of a hexagon as our mesh for a 2D poloidal plane.

#### Some advantages:

- No singular points
- (Hopefully) no need of multiple patches for the core of the tokamak
- Twelve-fold symmetry ⇒ more efficient programming
- Easy transformation from cartesian to hexagonal coordinates
- Easy mapping to a disk

## The Backward Semi-Lagrangian Method

We consider the advection equation

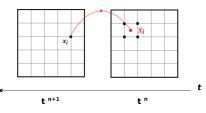

$$\frac{\partial f}{\partial t} + \mathbf{a}(x, t) \cdot \nabla_{\mathbf{x}} f = 0 \tag{1}$$

#### The scheme:

- Fixed grid on phase-space
- ullet Method of characteristics : ODE  $\longrightarrow$  origin of characteristics
- ullet Density f is conserved along the characteristics

i.e. 
$$f^{n+1}(\mathbf{x}_i) = f^n(X(t_n; \mathbf{x}_i, t_{n+1}))$$
 (2)

• Interpolate on the origin using known values of previous step at mesh points (initial distribution  $f^0$  known).

## The guiding center model: general algorithm

We consider a reduced model of the gyrokinetic model – a simplified 2D Vlasov equation coupled with Poisson–:

$$\begin{cases} \frac{\partial f}{\partial t} + E_{\perp} \cdot \nabla_X f = 0\\ -\Delta \phi = f \end{cases}$$
 (3)

#### The global scheme:

- ullet Known: initial distribution function  $f^0$  and electric field  $E^0$
- ullet Solve (Leap frog, RK4, ...) ODE for origin of characteristics X
- For every time step :
  - ▶ Solve poisson equation  $\Rightarrow E^{n+1}$
  - ▶ Interpolate distribution in  $X^n \Rightarrow f^{n+1}$

#### Two different approaches for interpolation step:

Spline and Hermite Finite Elements interpolations.

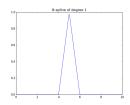

# First approach: B(asis)-Splines basis\*

B-Splines of degree d are defined by the **recursion** formula:

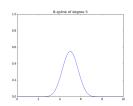

$$B_j^{d+1}(x) = \frac{x - x_j}{x_{j+d} - x_j} B_j^d(x) + \frac{x_{j+1} - x}{x_{j+d+1} - x_{j+1}} B_{j+1}^d(x)$$
 (4)

Some important properties about B-splines:

- Piecewise polynomials of degree  $d \Rightarrow$  smoothness
- Compact support ⇒ sparse matrix system
- Partition of unity  $\sum_i Bj(x) = 1$ ,  $\forall x \Rightarrow$  conservation laws

## First approach: Box-splines and quasi-interpolation

#### **Box-Splines:**

- Generalization of B-Splines
- Depend on the vectors that define the mesh
- Easy to exploit symmetry of the domain
- $\Rightarrow$  More efficient interpolation

#### Quasi-interpolation:

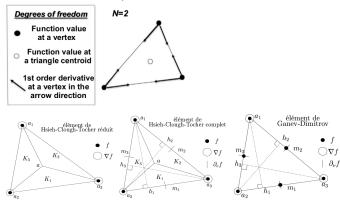

- Distribution function known at mesh points
- ullet Of order L if perfect reconstruction of a polynomial of degree L-1
- No exact interpolation at mesh points  $f_h(x_i) = f(x_i) + O(\|x_i\|^L)$
- $\Rightarrow$  Additional freedom to choose the coefficients  $c_j$

$$f_h(x) = \sum c_j \chi^L(x - x_j) \tag{5}$$

## Second approach: Hermite finite elements

Computed from the value of the function and its derivatives in various directions at various points.

Five in total have been implemented and tested:

#### Circular advection test case

In order to compare the two families' performances:

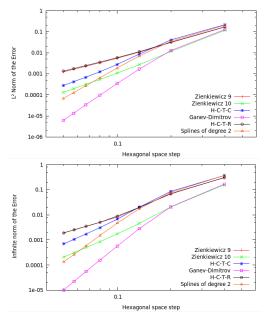

$$\partial_t f + y \partial_x f - x \partial_y f = 0 \tag{6}$$

Taking a gaussian pulse as an initial distribution function

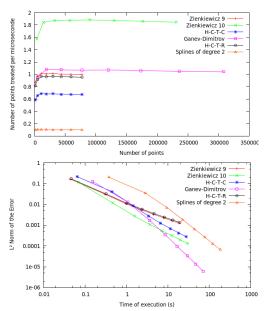

$$f^{n} = exp\left(-\frac{1}{2}\left(\frac{(x^{n} - x_{c})^{2}}{\sigma_{x}^{2}} + \frac{(y^{n} - y_{c})^{2}}{\sigma_{y}^{2}}\right)\right)$$
(7)

Constant CFL ( CFL=2 ) ,  $\sigma_x=\sigma_y=\frac{1}{2\sqrt{2}}$  , hexagonal radius : 8. Null Dirichlet boundary condition .

## Circular advection: results 1

### Circular advection: results 2

## Conclusion and perspectives

- Hexagonal mesh for SELALIB
- Comparison between two families of finite elements.

Splines: good precision but poor efficiency.

Amongst the other tested elements the complete Zienkiewicz's one seems to be the best choice in this case, at the moment.

#### Perspectives

Optimization.

Abstract classes.

Finite element solver of Poisson's equation on hexagonal mesh.
